The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 67-72 and 74-82 are rejected under 35 U.S.C. 102(e) as being anticipated by Martin, US 5,653,743. Because of the similar diameters of the bottom end 6 (column 2, line 63) and the opening 7 and short tube graft 8 (column 2, lines 65-67) and because of the compressible, self-expanding mesh supports (column 2, lines 53-54; column 3, lines 3-5; column 4, lines 15-18; etc.), the extender 18 is certainly capable of mating with the longer leg 6, even though such was not the intent. (Note: the length of the leg 6 as measured from the center of the opening 7 to the bottom end 6 is greater than the length of the leg 8, as seen from the dimensions set forth at column 2, line 65, through column 3, line 3.) If the extender 18 engages the longer leg 6 after the graft 2 has been placed in vasculature, it is likely that one of the arteries at a bifurcation would be obstructed. However, at the time of the present invention it was known that such a problem could be overcome with bypass surgery, as evidenced by column 2, lines 1-7, of Goicoechea et al., US 5,800,508 (MPEP § 2131.01, section III). Although such a procedure clearly has disadvantages, the Martin structure nonetheless falls within the scope of the claim language that "the extender [is] configured to mate with the first leg after the body is placed in vasculature" (instant claim 67, last two lines). Regarding claims 70 and 82, in view of the diameter range specified at column 2, lines 61-62, and because of the aforementioned selfexpanding mesh supports, the superior end 5 is capable of being placed within an aorta of a

Application/Control Number: 09/777,274

Art Unit: 3738

small mammal, with the first leg 6 being placed in an iliac artery, even though such was not the

intent.

The Applicant's arguments as to the lack of motivation for modifying Martin '817 with

"additional components like those of the '743 patent to effect a reconstruction" (page 5, lines 13-

14, of the Applicant's Response of November 30, 2004) in view of the fact that Martin '817

employs angiography to measure lengths associated with the aorta and the common iliac arteries

(US 5,575,817: column 1, lines 54-60) is persuasive. However, the claims do not patentably

distinguish over the prior art as seen from the new grounds of rejection set forth above.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Dave Willse whose telephone number is (571) 272-4762. The

examiner can normally be reached Monday through Thursday and often on Friday. If attempts to

reach the examiner by telephone are unsuccessful, the examiner's supervisor, Corrine

McDermott, can be reached at (571) 272-4754. The fax phone number for the organization

where this application or proceeding is assigned is (703) 872-9306. Any inquiry of a general

nature or relating to the status of this application or proceeding should be directed to the

receptionist whose telephone number is (703) 308-0858.
